Correction: Sentences on pages 5 and 24 of this report previously stated that the Southeast region is projected to lose population between 2015 and 2045. The Southeast region is projected to gain 260 people over the period. The text has been corrected. (May 2016.)

Preface

Alaska Population Projections

This report describes Alaska's projected future population based on historical population data and rates of fertility, mortality, and migration. These projections provide planners and policy makers with possible outcomes of a series of demographic events.

It is important to note that Alaska is susceptible to many unpredictable events, and that no demographer or economist is able to foresee the future. Our projections are based on past and hypothetical future population trends.

Special acknowledgment goes to the Alaska Department of Health and Social Services for providing essential information for these projections.

We welcome comments or suggestions on the content or format of this publication. Many of the most requested statistics in this document are also available on the Research and Analysis Web site at laborstats.alaska.gov. Send requests for demographic projections information to Eddie Hunsinger, Research and Analysis Section, Alaska Department of Labor and Workforce Development, P.O. Box 115501, Juneau, AK 99811-5501. Telephone: (907) 269-4960; FAX: (907) 465-4506; e-mail: eddie.hunsinger@alaska.gov.

Introduction and Overview

Alaska Population Projections

These population projections cover 2015 through 2045 for Alaska by age and sex as well as for Alaska Native and region, borough, and census area populations.

Population projections are distinct from population estimates in that estimates use current and historical data to make statements about the present and past population, while projections use expected or extrapolated data to make statements about future populations. Though projections are uncertain, they're based on reasoned assumptions and are an important tool for planners and policy makers.

To create this set of projections, we used a cohort-component technique, separating the population of males and females into age groups and aging them forward in time. We then added projected births and in-migrants and subtracted projected deaths and out-migrants.

The projections begin with Alaska's July 2015 population estimates and end with projections for 2045. Appendix B provides technical details.

These projections are for residents as defined by the U.S. Census Bureau. The Census Bureau uses the concept of "usual residence" (self-reported) to determine where people are counted.

Statewide Projections

Alaska's population is projected to increase from 737,625 in 2015 to 899,825 in 2045. As the population ages in the coming years, annual natural growth is expected to slow. Alaska's population aged 65 or older is expected to grow at the fastest rate (86 percent) over the projection period followed by the population aged 0 to 19 (19 percent). The population aged 20 to 64 is projected to grow at the slowest rate (13 percent).

Because growth is so uncertain, we created three scenarios for the statewide projections. We divided the population into single-year age groups by sex and projected forward one year at a time. We repeated this process three times, keeping the mortality and fertility projections the same but varying the net-migration rate. The middle projection for Alaska uses an annual net-migration rate of 0, the high scenario uses a net-migration rate of 1 percent, and the low scenario uses a net-migration rate of -1 percent.

We also developed a special scenario (Appendix A) that repeats the time series of 1985 to 2015 annual net-migration totals for the projected 2015 to 2045 period, to show the sensitivity of the future population to annual changes in net-migration.

Alaska Native Projections

The Alaska Native population, including Alaska Natives who report more than one race, is expected to continue to grow over the projection period, from 143,868 in 2015 to 184,561 in 2045. Like the state as a whole, the Alaska Native population's growth is expected to slow as the population ages.

To create projections for the Alaska Native population, we divided the population into five-year age groups by sex, then projected forward in five-year intervals. We created projections of mortality, fertility, and migration rates based on recent time series data.

Region, Borough, and Census Area Projections

Alaska's individual regions, boroughs, and census areas have grown and are projected to continue to grow at very different rates, with the fastest population growth in the Anchorage/Mat-Su Region.

For projections by borough and census area, we broke the populations into five-year age groups by sex and projected in five-year intervals using the cohort-component method. We created projections of mortality, fertility, and migration rates for each borough and census area based on recent time series data.

We projected each borough and census area population separately, with the sum of all borough and census area projections closely matching the statewide middle scenario projection at each step. We eliminated any discrepancies between the sum of the borough/census area projections and the statewide middle scenario projection with proportional fitting (described in Appendix B).

Section 1

Statewide Population Projections

As of July 1, 2015, Alaska's estimated population was 737,625.

Population change has four distinct processes, or components: fertility, mortality, in-migration, and out-migration. We used historical data on each of these components to create these projections.

This section begins with a brief description of Alaska's recent population background, then describes Alaska's mortality, fertility, and migration levels and their impact on the projections. Finally, it presents the results and interpretation of the statewide projections.

Background

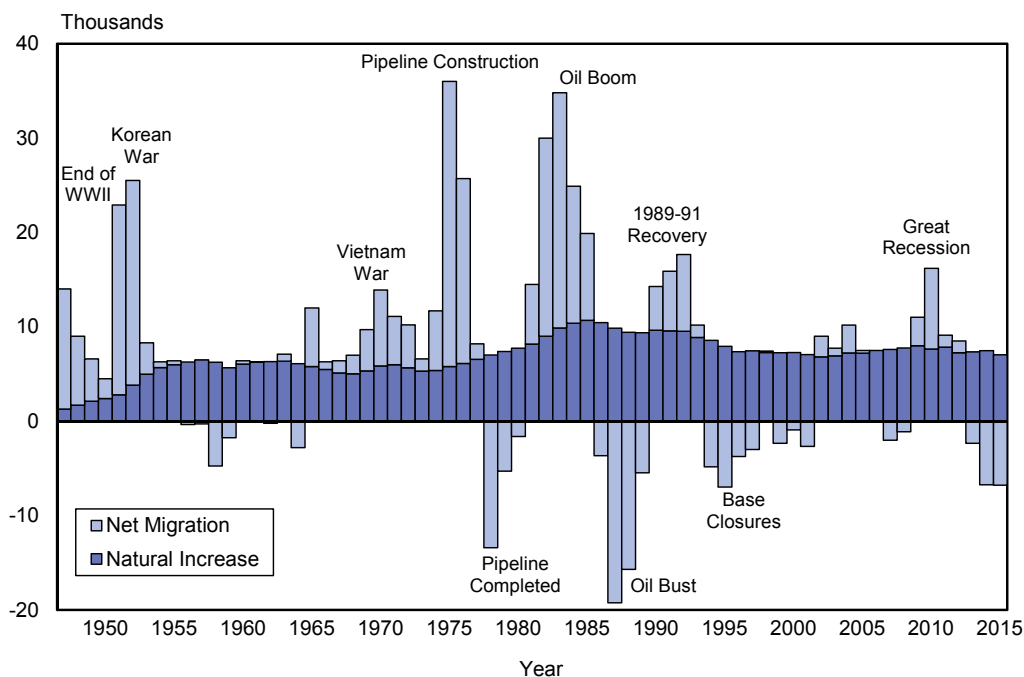

Since statehood in 1959, when the population was roughly 224,000, Alaska has grown at varying rates. As Figure 1.1 shows, both natural increase (the difference between births and deaths) and net-migration (the difference between in-migration and out-migration) have played important roles. Since statehood, natural increase has provided Alaska with steady growth.

In- and out-migration have been far more uncertain components of this population change, as the numbers of people moving into and out of the state have varied greatly from year to year.

The discovery of oil in Prudhoe Bay in 1968 and the subsequent construction of the Trans-Alaska Oil Pipeline in the 1970s had a massive effect on Alaska's population, both immediately and in the following decades. Tens of thousands of workers and their dependents poured into the state for the construction of the pipeline, and many left at its completion. In the years that followed, a huge number of migrants flowed into Alaska with new oil revenues and increased oil prices, but a large number left when oil prices fell dramatically in 1985.

These projections don't include events on the scale of the Trans-Alaska Oil Pipeline. They do happen, however, and the oil discovery at Prudhoe Bay demonstrates that major economic events are always possible.

Cohort-Component Method

We created this set of population projections through a “cohort-component” technique. Under this approach, we separated the population into specified age groups by sex and aged them forward in time, adding projected births and in-migrants at each step while subtracting deaths and out-migrants.

Two of the distinct benefits of this approach are its careful disaggregation of the components of population change and its production of projections by age and sex.

To estimate the effects of mortality and fertility on population change, we applied distinct rates of mortality and fertility to each age-sex group as we aged them forward. To estimate the impact of migration, we applied the number of people resulting from annual ratios of in- and out-migration to age-by-sex profiles. We then added the calculated number of in-migrants to each respective age-sex group, and subtracted the number of out-migrants from each group.¹

¹Further description of the cohort-component method is provided in Preston, Heuveline, and Guillot (2001).

Migration and Alternative Scenarios

Two values project migration for Alaska: the annual ratio of in-migrants (the number of in-migrants divided by Alaska’s mid-year population), and the annual rate of out-migration (the number of out-migrants divided by the mid-year population). The difference between the in- and out-migration values is the net-migration ratio, which is equal to the total number of in-migrants minus the total number of out-migrants, divided by the mid-year population.

Because uncertainty about the future is a major factor in all population projections and migration is the most uncertain component of population change, these projections include three scenarios with varying net-migration ratios.

Figure 1.3 shows the dramatic swings of Alaska’s net-migration ratio in the past and the three net-migration ratio paths we used for the different projection scenarios: the 0 percent middle scenario, 1 percent high scenario, and -1 percent low scenario.²

For the last couple of years, Alaska’s net-migration has been negative, but because the future isn’t clear, countless scenarios are possible. Future employment will play a large role in migration, but changes in unemployment and labor force participation rates can play equally important parts.

Although the differences between the scenarios we use may appear slight, they result in large differences in the projected population once each scenario is applied to our 30-year future projection period. While a number of states over recent decades have had net-migration consistently around 1 percent or more of total population — including Nevada, Arizona, Washington, and Colorado — no state’s net-migration has remained around -1 percent per year. Comparing 1980 to 2010 total population shows West Virginia was the only state with a loss — from 1.95 million to 1.85 million residents.

Mortality

Life expectancy at birth (or period life expectancy at birth) for a given year is the average number of years a person would live if he or she lived an entire life according to the respective year’s age-specific mortality rates. Although life expectancy varies greatly from group to group within Alaska, Alaska’s total life expectancy has been fairly close to that of the United States as a whole.

As Table 1.2 shows, life expectancies in Alaska and the U.S. have been similar, with both steadily increasing over recent decades. Given the stability of mortality rates in Alaska, we applied a single path for change based on the U.S. Social Security Administration’s projected future change in U.S. mortality.

²In addition to these scenarios, Appendix A provides a special scenario that repeats the 1985 to 2015 time series of net-migration ratios for 2015 to 2045.

The Social Security Administration projects that between 2010 and 2040, life expectancy will increase by 3.1 years for American men and 2.5 years for American women. Following fitted parameters based on this change, we expect life expectancy in Alaska to increase by 3.2 years for men and 2.5 years for women between 2010 and 2040.³ Over the entire projection period, 2015 to 2045, Alaska’s male life expectancy is projected to increase from 76.7 to 79.6, with female life expectancy rising from 81.1 to 83.0.

Fertility

The total fertility rate, or TFR, for a specific year is the number of children a woman would have if she followed that year’s age-specific fertility rates throughout her lifetime. A TFR of approximately 2.1 (children per woman) is necessary for long term replacement-level natural increase.

Figure 1.2 displays historical estimates for Alaska’s TFR. Alaska’s TFR has declined some in recent years but, at around 2.2 between 2012 and 2014, it remains higher than the U.S. average (1.9) and still provides steady growth from natural increase.

Components of Change

Table 1.3 provides projections of future levels of births, deaths, and net-migration. The middle values are the expected births, deaths, and net-migration with a net-migration ratio of 0 percent. The high and low projections of births, deaths, and net-migration are the projected values if the net-migration ratio for Alaska were 1 percent and -1 percent, respectively.

The middle and high projection scenarios show an increase in the number of births while the low scenario projects a slight decline in births. As the projection extends toward 2045, the difference in the projected number of births becomes much larger due to the accumulating difference in numbers of net-migrants.

We expect the number of deaths in Alaska to increase greatly over the projection period. With the aging of the “baby boom” generation (those born in the high fertility period from 1946 to 1964), Alaska — like all states — will have a much larger elderly population than in the past, which will raise the annual number of deaths. Increasing differences in expected numbers of deaths are due to the varying levels of migration for each of the projection scenarios.

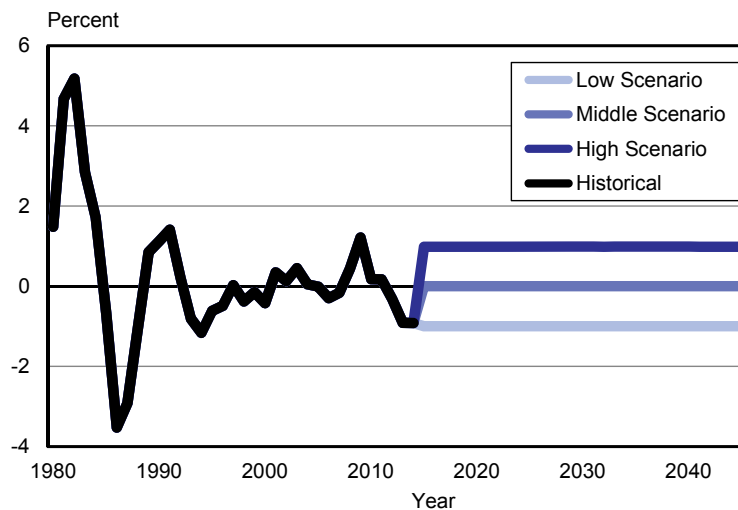

³Appendix B provides the method for fitting the mortality parameters.

Alaska's Population Growth

Table 1.4 displays projections of the levels of population growth in Alaska from 2015 to 2045 and the outcome of different growth levels on the projected statewide population.

With the expected increase in deaths relative to births, it's likely the growth rate will decline over the projection period. The middle and high projection scenarios show overall increases for population while the low scenario projects a substantial loss in population.

Figure 1.4 displays the different paths projected for Alaska's total population through 2045. With time, the different scenarios for Alaska's net-migration cause differences between projected populations to increase greatly.

The middle projection produces a population for 2025 of 802,352, growing to 854,104 in 2035 and reaching 899,825 by 2045. The low scenario has population dropping to 642,697 by 2045, and the high has it increasing to 1,247,887 people.

Future Population by Age and Sex

Tables 1.5 to 1.7 break down projections for Alaska's population by age and sex for each of the three scenarios. The median age of Alaska's population is projected to increase at a steady pace, rising from 34.5 in 2015 to 36.8 in 2045. The ratio of males per 100 females is expected to decline from 107.5 to 104.8.

Figures 1.8 through 1.11 show population pyramids for the middle scenario for 2015, 2025, 2035, and 2045.

Table 1.4
Population Projections for Alaska, 2015 to 2045

Selected Age Groups

Figures 1.4 through 1.7 display the projected population for specified age groups. Alaska's population ages 0 to 19 is projected to increase 19 percent, from 206,201 to 244,367 between 2015 and 2045.

Alaska's population aged 20 to 64 is an approximate representation of the working-age population. Alaska's 20 to 64 year old population was 456,571 in 2015 and is projected to be 516,149 in 2045, a 13 percent increase. As baby boomers move into retirement years, the echo boomers will continue to age through their working years, yielding little change in the working-age population in the first 15 years of the projection period. (See Figure 1.10.)

The population aged 65+ is largely made up of retirees. While there is a great deal of uncertainty about future population for younger ages, which are substantially affected by shifts in fertility and migration rates, people at higher ages are less affected by these. Alaska's large cohort of aging baby boomers means strong growth in Alaska's senior population is very likely.

Alaska's current population aged 65 or older is 74,853 and is projected to increase 86 percent by 2045, reaching 139,309 people. Toward the end of the projection period, all baby boomers will be well into this age group.

Section 2

Alaska Native Population Projections

This section presents projections for the Alaska Native population by age and sex from 2015 through 2045. We created these projections based on our estimate for the number of Alaska Natives who are Native alone or in combination with one or more other races.¹ While all Native Americans residing in Alaska are included in the Native projections, this group is almost entirely Alaska Native and will be referred to here as Alaska Native.

The Alaska Native population represents approximately 20 percent of the state's population. With high fertility and relatively low rates of migration, population growth is steady for Alaska Natives. Be aware, though, that we based these projections on recent rates, which will vary somewhat over time.

Methodology

We divided the Alaska Native population into five-year age groups according to sex, then projected forward in five-year increments from the 2015 Alaska Native race alone or in combination population estimates, using the cohort-component method. We then added projected births, subtracted deaths, and subtracted net-migration from the appropriate age-by-sex group.

Migration

Alaska Natives' rates of migration into and out of Alaska are relatively low compared to the state as a whole. After analyzing data from the 2005, 2010, and 2015 race alone or in combination estimates, along with birth and death data, we set the annual net-migration ratio at -0.5 percent of the population per year. The projections continue this level of net-migration through 2045.

¹Appendix B further describes the Alaska Native estimates, the projection methods, and the methods for estimating age-by-sex-specific mortality, fertility, and migration.

Overall Population Change

The Alaska Native population is projected to grow steadily through 2045, from 143,868 in 2015 to 184,561 in 2045. Further, we project Alaska Natives to slightly increase their share of Alaska's total population, from 19.5 percent in 2015 to 20.5 percent in 2045. Annual births and deaths for Alaska Natives are both projected to increase over the period, however, we expect births to be consistently higher than deaths.

Aging

Aging will play an important role in population change for Alaska Natives over the projection period, as their median age is projected to rise from 27.3 to 29.8. The proportion of the Native population aged 65+ is projected to increase greatly between 2015 and 2045, rising from 7 percent to 12 percent.

Section 3

Alaska Region, Borough, and Census Area Projections

This section presents population projections for Alaska's economic regions, boroughs, and census areas by age and sex. Population projections for smaller areas have a much higher degree of uncertainty. Migration between boroughs, specific policy and economic factors, and unique historical events will all play important roles in determining actual population change.

Borough and census area projections are based on recent trends. Be aware that countless unforeseen factors could sway many of the populations dramatically. The projected populations for each economic region, borough, and census area are presented by age and sex in five-year age groups from 2015 to 2045.

Methodology

For each borough and census area projection, we divided the population into age-by-sex groups and projected them forward in five-year increments from the 2015 population estimate using the cohort-component method.¹ We then added projected births and in-migrants and subtracted deaths and out-migrants from the appropriate age-by-sex group at each step. The projections for Alaska's economic regions are the sums of the boroughs and census areas they cover.

We projected each borough/census area population independently, using recent age-specific fertility rates to project births, recent and projected age-by-sex-specific mortality rates to project deaths, and recent annual migration data (adjusted for five-year intervals) and age-by-sex migration profiles to project migration.

We held constant the group quarters population (population not living in households) in age, sex, and size for Aleutians East Borough, Aleutians West Census Area, and North Slope Borough.²

The sum of the borough and census area projections at each step matched closely to the middle statewide projection. Proportional fitting eliminated any discrepancies between the middle state projection and the sum of the borough and census area projections.

¹Further description of the cohort-component method is provided in Preston, Heuveline, and Guillot (2001).

²Appendix B further describes the methods for estimating age-specific mortality, fertility, and migration rates.

Births

Alaska's crude birth rate (the number of births per 1,000 people) in 2015 was 15.4. With the overall aging of Alaska's population, this figure is projected to decline to approximately 14.1 by 2045.

Birth rates vary greatly across boroughs and census areas. The highest crude birth rates in 2015 were in Kuskilvak Census Area (27.8), Nome Census Area (24.2), Bethel Census Area (22.4), and Northwest Arctic Borough (20.0).

The lowest birth rates for 2015 were found along the Aleutian chain and primarily in Southeast Alaska. In the Aleutians East Borough and Aleutians West Census Area, where much of the population lives in group quarters for fishing and fish processing, the crude birth rates were 3.2 and 5.0, respectively. Other areas with low birth rates included Haines Borough (6.8), the City and Borough of Sitka (8.2), and Hoonah-Angoon Census Area (8.3).

The rank-order of crude birth rates for boroughs and census areas probably will not change much over the projection period. While birth rates will change as the population composition shifts, places with relatively high birth rates will likely remain high and those with low rates will remain relatively low.

Deaths

Alaska's crude death rate (the number of deaths per 1,000 people) in 2015 was 5.8. The greatest contributing factor to this figure was the ratio of senior citizens to the overall population.

Like crude birth rates, crude death rates vary among areas. The highest 2015 rates were in the City and Borough of Wrangell (12.7), Lake and Peninsula Borough (11.4), and Yukon-Koyukuk Census Area (9.6). Those with the lowest crude death rates included Aleutians East Borough (2.5), Aleutians West Census Area (3.0), and Municipality of Skagway Borough (3.8).

As Alaska's population ages over the projection period, crude death rates will likely increase in all boroughs and census areas.

Migration

As with statewide migration, migration into and out of Alaska’s boroughs and census areas represents a highly unstable component of population change. We used two values to project migration for Alaska’s boroughs and census areas: the annual net-migration ratio (net-migration divided by the borough or census area’s mid-year population) and the annual out-migration rate (the number of out-migrants divided by the borough or census area’s mid-year population). We estimated out-migration and net-migration levels for each borough/census area based on 2005 to 2015 data to project migration through 2045.

We distributed the migrants proportionally using age-by-sex migration profiles to estimate the number of migrants for each specific age-by-sex group. The migration levels applied for the projection period reflect those from recent history.

Areas we expect to have positive net-migration throughout the projection period include Matanuska-Susitna Borough and Kenai Peninsula Borough.

Rural boroughs and census areas with high fertility rates, such as Kusilvak Census Area, Nome Census Area, and Northwest Arctic Borough, are projected to lose the most population through net-migration but continue to grow overall through natural increase.

Overall Results

As shown in Figure 3.1, we project the strongest growth for the Anchorage/Mat-Su Region, with Matanuska-Susitna Borough’s population projected to increase by more than 80 percent over the period. The continuation of recent population trends for Alaska’s economic regions include some degree of growth over the period for each of Alaska’s economic regions.

We do not expect the population rank-ordering of the regions to change over the projection period. Through high fertility rates, the Northern and Southwest regions are projected to continue growing despite somewhat strong net losses from migration.

The boroughs/census areas with the highest levels of projected average annual growth over the period include: Mat-Su Borough (1.9 percent), Kusilvak Census Area (1.5 percent), Bethel Census Area (0.9 percent), and Nome Census Area (0.9 percent). The boroughs/census areas projected to have the highest levels of average annual population loss over the period are Bristol Bay Borough (-1.4 percent), City and Borough of Yakutat (-1.1 percent), and Valdez-Cordova Census Area (-0.8 percent).

Appendix A

Special Scenario: A repeat of the last 30 years for migration

This appendix provides a special scenario that repeats the time series of 1985 to 2015 annual net-migration ratios for the projected period of 2015 to 2045. The methods, age profiles, and fertility and mortality indices we applied for this scenario are the same as those used for the statewide high, middle, and low scenarios¹ — the only difference is the time series of inputs for the overall level of net-migration.

This scenario is intended to show the sensitivity of future population to the annual shifts in net-migration, such as those Alaska has had in the past. It is not intended to predict future net-migration for Alaska.

The Historical Data

With new revenue from oil production after the completion of the Trans-Alaska Oil Pipeline, Alaska experienced a massive economic boom between 1980 and 1985. The state gained more than 75,000 people from net-migration alone over those five years. Then, with falling oil prices and an economic recession, net-migration fell precipitously with more than 40,000 more people moving from Alaska than to Alaska between 1985 and 1989.

Economic recovery followed, and with ups and downs from 1990 on, net-migration typically remained within plus-or-minus 1 percent of the total population from year to year (see Figure A-1).

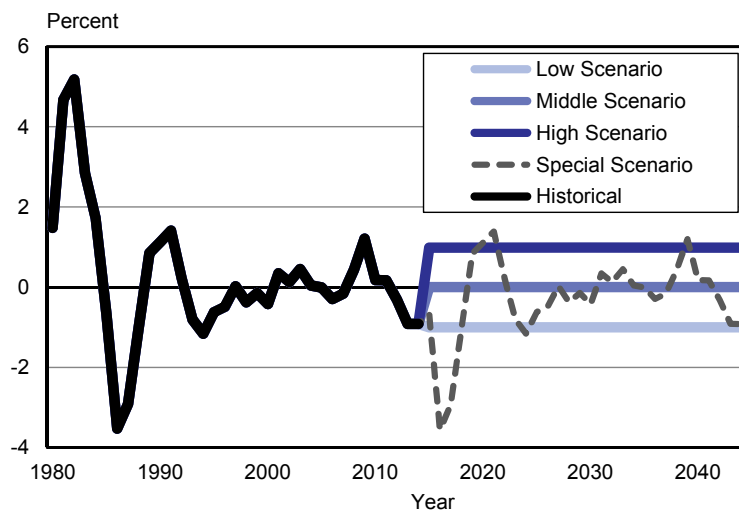

Notably, net-migration has been at approximately -1 percent for the last couple of years (2013 to 2014 and 2014 to 2015), and this has kept the state population essentially flat. If Alaska had experienced those same net-migration losses 30 years prior, when the population was younger and there were more births and fewer deaths, the state would still have gained more than 3,000 people annually.

A Bust with No Boom

Applying 1985 to 2015 net-migration to the current projection period includes the substantial drop between 1985 and 1989 but with no preceding boom or net-migration recovery to match the drop. This means projections from it will be less than the middle scenario of fixed 0 percent net-migration in this report. It would remain substantially higher than the low scenario, however.

¹Appendix B provides information on the projections methods.

Figure A-1
Alaska Net-Migration Ratio with Special Scenario, 1980 to 2045

Source: Alaska Department of Labor and Workforce Development, Research and Analysis Section

Effect on Total Population

According to this special scenario for net-migration, Alaska’s population would drop to 704,607 in 2019, then increase by 17 percent to reach 824,654 in 2045 — 8 percent lower than the 899,825 middle scenario projection. (see Figure A-2 and Table A-2.)

Annual net-migration would average -0.3 percent for the 30-year period, accounting directly for an average annual loss of 2,063 people, which would be counteracted by gains through natural increase (births minus deaths). Births and deaths for respective years would also be marginally lower than the middle scenario due to fewer people in the state (see Table A-1).

After the abrupt population loss and rebound at the beginning of the period, population growth would slow over time with population aging, which will yield relatively fewer births, more deaths, and smaller gains through natural increase. While the negative net-migration of the past couple of years has kept state population change near 0, when applied 30 years into the future, it yields population losses of more than 3,000 per year.

Population by Age and Sex

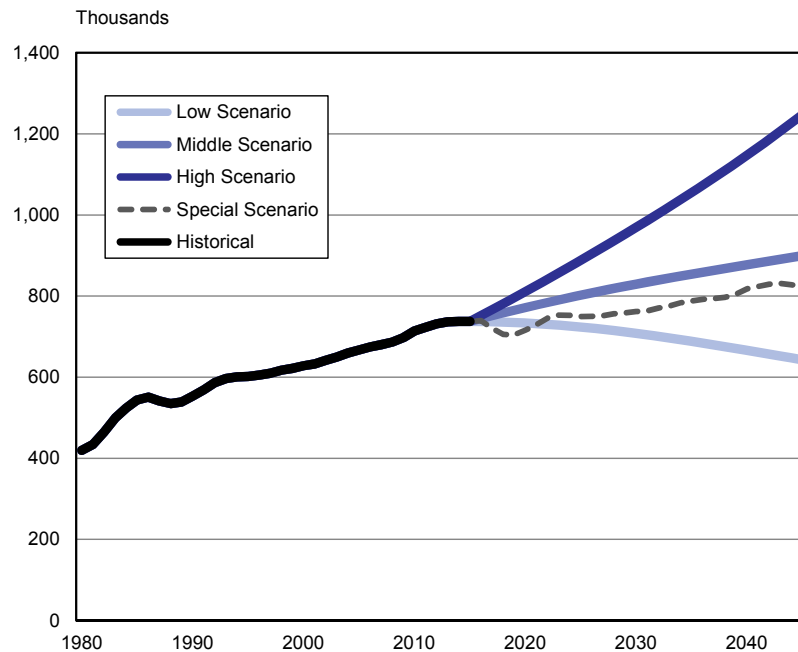

The structure of Alaska’s population by age and sex would change little under this special scenario. The median age of Alaska’s population would still increase at a steady pace, rising from 34.5 in 2015 to 36.8 in 2045: the same as the middle scenario. The ratio of males per 100 females would decline from 107.5 to 104.1, versus 104.8 in 2045 under the middle scenario.

Compared to the middle scenario, Alaska’s population ages 0 to 19 would be most affected by the net-migration shifts in the special scenario. It would increase 9 percent between 2015 and 2045 and reach 224,144, compared to a 19 percent increase to 244,367 under the middle scenario.

The 20 to 64 year old population would see a decrease between 2015 and 2020, from 456,571 to 419,411, and then increase to reach 472,609 in 2045 — 43,540 lower than the middle scenario’s 516,149.

Alaska’s population aged 65+ would be 127,901 in 2045 under the special scenario, which would be a 71 percent increase from 2015 but 11,408 lower than the middle scenario’s projected 139,309 seniors.

Appendix B

Technical Notes

This technical appendix explains the methods used to produce the 2015 to 2045 Alaska population projections. It first presents methods we used to estimate and project statewide mortality, fertility, and migration rates, then describes how we applied these estimates with a cohort-component model.

Next, this appendix discusses how we projected each borough and census area's mortality, fertility, and migration rates, and how we applied these rates with a cohort-component model.

Finally, it explains the race “alone or in combination” estimates and the methods for projecting Alaska Native births, deaths, migration, and population. All computations used the R statistical package, SPSS, and Microsoft Excel.

Statewide Mortality

We used the Brass relational logit model for mortality (Preston, Heuveline, and Guillot, 2001) to project mortality rates. Projected mortality rates are based on a linear interpolation of Brass coefficients calculated from Social Security life tables for the United States for 2010 and 2050 (Bell and Miller, 2005), by sex. We then applied the interpolated coefficients to a 2010 to 2012 Alaska life table, created using Alaska vital statistics data, producing age-specific mortality rates for 2015 through 2045 for males and females.

Statewide Fertility

To project fertility, we used 2012 to 2014 Alaska vital statistics data to create a proportional age-specific fertility profile. We then multiplied the profile by a total fertility rate (sum of age-specific fertility rates) of 2.2 and held it constant across the projection period.

Statewide Migration

Two values project migration for Alaska: the annual ratio of in-migrants (the number of in-migrants divided by Alaska's mid-year population), and the annual rate of out-migration (the number of out-migrants divided by the mid-year population).

The difference between the in- and out-migration values is the net-migration ratio, which is the total number of in-migrants minus the total number of out-migrants, divided by the mid-year population.

To make the different net-migration scenarios, we adjusted both the in-migration ratio and the out-migration rate. For the middle scenario, we used an annual net-migration ratio of 0 and set both the in-migration ratio and the out-migration rate at 6 percent. For the high scenario, which has a 1 percent net-migration ratio, we set the in-migration ratio to 6.5 percent and the out-migration rate to 5.5 percent. For the low scenario, which has a -1 percent net-migration ratio, we set the in-migration ratio to 5.5 percent and the out-migration rate to 6.5 percent. For the special scenario in Appendix A, we used the respective in-migration ratios and out-migration rates for 1985 to 2015 to set the projected net-migration ratios.

We then assigned the overall numbers of in- and out-migrants to the proper age-by-sex categories based on share profiles for in- and out-migration. We estimated migration share profiles by subtracting births and deaths from age-specific Alaska Permanent Fund Dividend applicant nonmatches, or people who were absent from one year of two consecutive annual Permanent Fund applicant files.

Statewide Projection Model

Once we calculated the necessary components, we applied them with a cohort-component projection model (Preston, Heuveline, and Guillot, 2001). For this model, we used Leslie Matrices to project natural increase — the effects of births and deaths on a population — while subtracting projected out-migrants and adding in-migrants at each step. We ran this model three times with the different migration scenarios to produce the middle, high, and low projections.

Borough and Census Area Mortality

Given the very small populations of Alaska boroughs and census areas, it wasn't practical to create age-by-sex specific mortality rates at the sub-state level. Rather than apply the statewide levels of mortality to each borough and census area, we decided to account for the distinct racial composition of each area and adjust the levels of mortality accordingly. We linearly interpolated levels of mortality between statewide Alaska Native and non-Native life tables based on the total proportion of Alaska Natives in each borough and census area.

The next step was to apply the Brass projection coefficients that were calculated for statewide mortality to the interpolated life tables. Applying the Brass coefficients yielded age-specific rates of mortality for 2015 through 2045, based on the U.S. Social Security Administration's projected change in U.S. mortality.

Borough and Census Area Fertility

We calculated age-specific fertility rates for each borough and census area using data from 2010 to 2014 with adjustments for group quarters populations (population not living in households), and held those rates constant through the projection period.

Borough and Census Area Migration

We estimated migration for each borough and census area using the net-migration ratio and the out-migration rate of each area, based on 2005 to 2015 population estimates and Alaska Permanent Fund data, with adjustments for births, deaths, and groups quarters populations. Adding the net-migration ratio to the out-migration rate produced the in-migration ratio (number of in-migrants divided by the mid-year population). We distributed migrants according to age-by-sex migration share profiles, estimated from Alaska Permanent Fund data.

The net-migration ratios of boroughs and census areas are set to gradually converge toward the 0 net-migration ratio of the middle state projection — sub-state net-migration rates are halved over the projection horizon. This adjustment allows boroughs and census areas with positive net-migration to continue gaining a reasonable number of in-migrants while keeping boroughs/census areas with high net-migration losses from losing an unreasonable number of people to out-migration.

We further adjusted net-migration ratios for Bristol Bay Borough, the City and Borough of Sitka, and the City and Borough of Yakutat by halving their negative ratios, because results based strictly on the historical data were unreasonably low.

Borough and Census Area Projections

For borough and census area projections, we used the cohort-component method, like the state projection but with five-year steps instead of single-year because of the smaller populations. We ran the model separately for each borough and census area, putting in each area's unique components of change.

To measure the closeness of the statewide and sum-of-borough population projections by age and sex, we calculated the “mean absolute percent error” (Smith, Tayman, and Swanson, 2001) across the ages and sexes and found less than 10 percent average errors among the age-by-sex groups for each projection step. We then proportionally adjusted the sub-state age-by-sex projections to match the middle state age-by-sex projection (Smith, Tayman, and Swanson, 2001).

Alaska Native Alone or In Combination

Beginning in 2000, the U.S. Census Bureau reformatted its race question, allowing people to select more than one race category. In previous population projections reports, we continued to provide Alaska Native and American Indian “bridged” data, which matched the pre-2000 categories, but with this release we provide projections for Alaska Native and American Indian alone or in combination with one or more other races.

Alaska Native Population Projections

To estimate age-by-sex-specific mortality rates for Alaska Natives, we used Alaska Native mortality data from the Alaska vital statistics for 2008 to 2012. We then applied the Brass coefficients from the U.S. Social Security Administration to project age-by-sex mortality through 2045.

To project fertility, we used 2013 to 2014 Alaska vital statistics data to estimate ratios of Alaska Native births by age of mother to the Alaska Native female population by respective age to create a proportional age-specific fertility profile. We then multiplied the profile by a total fertility ratio (sum of age-specific fertility ratios) of 3.0 (slightly lower than the estimated 3.1 for 2013 and 2014), and held it constant across the projection period.

To estimate migration for Alaska Natives, we used the cohort-component method with the mortality and fertility age-by-sex profiles but no migration to project the 2010 estimated population to 2015. We compared the projected values with separate 2015 Alaska Native population estimates to find cohort change differences, estimating the amount of migration occurring within each age-by-sex interval. We further adjusted the overall level of migration based on Alaska Native population estimates for 2000, 2005, 2010, and 2015.

Then, as we did with the boroughs and census areas, we used the cohort-component method to project the Alaska Native population by age and sex.
